Research Interests:

It is my growing passion to work with Energy Storage and Conversion Systems and this urges me to pursue research in Hybrid Energy Storage Devices. My research experience has granted me expertise in energy storage and conversion devices for hybrid electronics, which brings me closure to my goal of working towards self-powered energy storage and conversion devices. I aspire to become an accelerator in the field of Renewable Energy resources research with a focus on sustainable environment, so that I may make a meaningful contribution to the **“SDG 7: Affordable and Clean Energy”**.

With a growing need to boost the features of energy storage devices, researches are tending towards high energy density and power density of hybrid energy storage devices which will surpass the existing batteries used in commercial electronics. My emphasis is on experimentally developing electrodes for the batteries and supercapacitors with high energy and power density. In the current ongoing work, our team has seen interesting results that have been published in reputed international journals and also patent.

Apart from my thesis work, I have also worked in recycling different environmental waste materials such as spent batteries and plant wastes. These wastes have been collected and processed to potential electrode materials. Thus, wastes were successfully converted to pertinent energy storage devices and their performances were demonstrated by consumer electronics.

Expertise: Electrochemical Energy storage (Batteries and Supercapacitors)

Focus (Work continuing in other related field): Electrochemical Sensors, Water Splitting, Photocatalytic, Photodiode, Gas sensors, Re-cycling.

Little knowledge on Electrochromic devices, Metal air Battery, Fuel cell, Solar cells, SERS based research work.
